

INVITATION

Studying infrastructure in Mozambique LANDac workshop

July 3 2019 | 09:00 - 13:00

Mozambique's landscape is increasingly characterised by resource extraction projects and their associated large-scale infrastructure investments. Understanding the consequences of these changes for communities, land use and environment, requires researchers and practitioners from different fields to come together.

In this multidisciplinary seminar organised by Utrecht University, the ERC Infraglob project at the University of Groningen and LANDac, we'll discuss current research on infrastructure development in Mozambique, relating to issues of security, displacement and (international) extractive industries, among others. LANDac attendees with a particular interest in Mozambique and/or researching infrastructure development are more than welcome to register for the event with k.otsuki@uu.nl.

If you wish to present during the workshop, please send in your abstract to k.otsuki@uu.nl before 15th of June.
